User journey

This is a title...

IOT Enabled Smart Farmer

Phases	Implementation	Application usuage	Purchase
Usage Method	Implementation involves placing of sensors in the farm or garden. Users should place the sensors in their farm or garden in the appropriate location. Sensors should not be buried deep inside. Different sensors are needed for measuring different parameters and these sensors should be interfaced with the controller.	User can acquire the information from the sensors in the app. They can monitor the status of field in the app. They can control the interfaces like motor etc from everywhere by using app.	Cost of implementation depends on the number of sensors used. There is less maintenance cost. Even if one sensor is failed, there is no need for buying new one, other sensor's are enough.
Feelings	Customer's Experience	Positive moments	Negative moments
	It gives the smart maintenance of farming experience to the user. They can monitor and control the sensors from the app. They need not visit the farm often.	User can save the resources like water,fertilizers according to the climatic conditions and soil nature respectively. They can get more production. They need not buy a sensor if one of the sensors is faulty, it reduces maintenance cost.	For more places to monitor needs more sensors, this will increase the initial implementation cost. There is some maintenance cost also present. Implementation needs more space also.
